Why Open Source?

Why Open Source?

Closed Source vs. Open Source

©HarsimranSinghCS100W

Why Open Source?

Advantages

- No costs (!!!)

European Commision 2012: c.a. 450 billion euro savings p.a.

<https://joinup.ec.europa.eu/news/contribution-open-source-europes-economy-450-billion-year>

- Coherent standard with proprietary software

- Freedom to adjust and distribute program

- Transparency and Reproducibility

Rocchini and Neteler (2012) TREE, Barnes (2010) Nature

- Platform-independent

Why Open Source?

(Dis)advantages

- Comes without guarantee regarding bugs and features (but mailing lists and internet community)
- Sometimes smaller user communities (especially in companies and administration)
- In most cases less user-friendly/steeper learning curve

Review Article

An overview on current free and open source desktop GIS developments

STEFAN STEINIGER*† and ERWAN BOCHER‡

†Department of Geography, University of Calgary, Calgary, AB, Canada

‡Ecole Central de Nantes, IRSTV, Nantes Cedex, France

(Received 23 April 2008; final version received 19 October 2008)

Over the past few years the world of free and open source geospatial software has experienced some major changes. For instance, the website FreeGIS.org currently lists 330 GIS-related projects. Besides the advent of new software projects and the growth of established projects, a new Foundation has been established to offer an overview on existing free and open source understanding of the open source explanation of associated terms and in license types: the General Public License (GPL). After laying out the different desktop GIS software projects main tables summarise information currently available software versions. For open source software, with an emphasis

- R is a software (**much more!**) for statistical (**much much more!**) analyses
- Syntax : C++ family
- Object-oriented using classes
- Originally available in command line interface, popular editor: **RStudio**
- Also available in graphical user interface (GUI), e.g. “Duducer” and “R Commander”. **But forget about them!**

Why R?

You cannot do it with anything else!

Why R?

You cannot do it with anything else!

Analyses of Space-time data

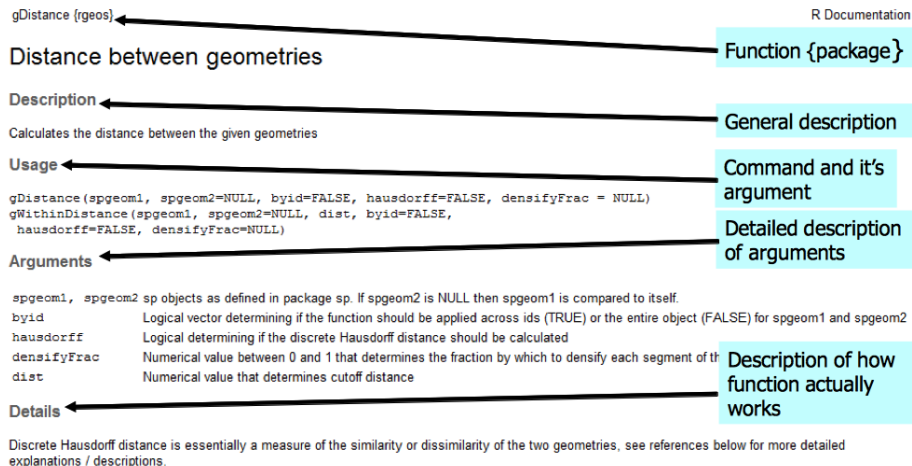

Co-interfacing with other software

Efficient big raster data analysis

R and moRe: Functions

R and moRe: Functions

What function
returns

Value

`gDistance` by default returns the cartesian minimum distance between the two geometries in the units of the current projection. If `hausdorff` is TRUE then the Hausdorff distance is returned for the two geometries.

`gWithinDistance` returns TRUE if returned distance is less than or equal to the specified `dist`.

Author(s)

Roger Bivand & Colin Rundel

Related functions

[`gWithinDistance`](#)

Examples

Examples, can be
run from R by
`gDistance()`

```
pt1 = readWKT("POINT(0.5 0.5)")
pt2 = readWKT("POINT(2 2)")
```

```
p1 = readWKT("POLYGON((0 0,1 0,1 1,0 1,0 0))")
p2 = readWKT("POLYGON((2 0,3 1,4 0,2 0))")
```

```
gDistance(pt1,pt2)
gDistance(p1,pt1)
```

R and moRe: Objects

Vector

- An array (collection) of numbers, strings or factors
- e.g. 1 2 3 4 5 or "a" "b" "c" "d" "e"

R and moRe: Objects

Vector

- An array (collection) of numbers, strings or factors
- e.g. 1 2 3 4 5 or "a" "b" "c" "d" "e"

Factor

- An array (collection) of level (grouping variables), can be numbers or strings
- e.g. a b c d e

R and moRe: Objects

Matrix

- A table where rows and columns contain vectors
- Vector types of columns and rows should be the same, e.g. either numeric or string, these can not be combined

	col 1	col 2
row 1	"a"	"c"
row 2	"b"	"d"

R and moRe: Objects

Matrix

- A table where rows and columns contain vectors
- Vector types of columns and rows should be the same, e.g. either numeric or string, these can not be combined

	col 1	col 2
row 1	"a"	"c"
row 2	"b"	"d"

Data Frame

- A table where columns contain vectors
- Vector types of columns can be different, e.g. numeric and string, and can be combined

	vector 1	vector 2
row 1	"a"	1
row 2	"b"	2

R and moRe: Objects

List

- A collection of elements, vectors or other objects

```
List[["Vector"]] "a" "b" "c" "d" "e"
```

```
List[["Matrix"]]
```

	col 1	col 2
row 1	"a"	"c"
row 2	"b"	"d"

```
List[["Data Frame"]]
```

	vector 1	vector 2
row 1	"a"	1
row 2	"b"	2

Spatial Packages

```
library(spacetime)
library(sp)
library(rgdal)
library(maptools)
library(mapdata)
library(raster)
library(rgeos)
library(spgrass)
library(tseries)
```

Integration with other spatial tools

- GRASS GIS ('spgrass6' package)
- SAGA GIS ('RSAGA' package)
- QGIS ('manageR' package)
- PostGIS (different solutions)
- ArcGIS ('RpyGeo' package) and many more...

Spatial objects: class()

```
SpatialPointsDataFrame  
SpatialLinesDataFrame  
SpatialPolygonsDataFrame  
SpatialGridDataFrame  
stfddf  
sp  
raster  
Extent  
Date  
xts, ts
```

Let's do it together!

Brain warming!

A piece of white lined paper with blue horizontal lines is centered on a light orange background. The paper has a torn right edge and a piece of grey tape at the top center. The word "Homework" is written in a dark purple, cursive-style font across the middle of the paper.

CRAN Task View: Analysis of Spatial Data

Maintainer: Roger Bivand

Contact: Roger.Bivand at nhh.no

Version: 2015-08-09

Base R includes many functions that can be used for reading, visualising, and analysing spatial data. The focus in this view is on "geographical" spatial data, where observations can be identified with geographical locations, and where additional information about these locations may be retrieved if the location is recorded with care. Base R functions are complemented by contributed packages, some of which are on CRAN, and others are still in development. One active location is [R-Forge](#), which lists "Spatial Data and Statistics" projects in its [project tree](#). Information on R-spatial packages, especially [sp](#) will be posted on the R-Forge rsatial project [website](#), including a visualisation gallery.

The contributed packages address two broad areas: moving spatial data into and out of R, and analysing spatial data in R.

The [R-SIG-Geo](#) mailing-list is a good place to begin for obtaining help and discussing questions about both accessing data, and analysing it. The mailing list is a good place to search for information about relevant courses.

There are a number of contributed tutorials and introductions; a recent one is [Introduction to visualising spatial data in R](#) by Robin Lovelace and James Cheshire.

The packages in this view can be roughly structured into the following topics. If you think that some package is missing from the list, please let me know.

- **Classes for spatial data** : Because many of the packages importing and using spatial data have had to include objects of storing data and functions for visualising it, an initiative is in progress to construct shared classes and plotting functions for spatial data. The [sp](#) package is discussed in a note in [R News](#). Many other packages have become dependent on these classes, including [rgdal](#) and [maptools](#). The [rgeos](#) package provides an interface to topology functions for [sp](#) objects using [GEOS](#). The [raster](#) package is a major extension of spatial data classes to virtualise access to large rasters, permitting large objects to be analysed, and extending the analytical tools available for both raster and vector data. Used with [rasterVis](#), it can also provide enhanced visualisation and interaction. The [spatial.tools](#) package contains spatial functions meant to enhance the core functionality of the [raster](#) package, including a parallel processing engine for use with rasters. The [micromap](#) package provides linked micromaps using [ggplot2](#). The [spacetime](#) package extends the shared classes defined in [sp](#) for spatio-temporal data (see [Spatio-Temporal Data in R](#)). The [Grid2Polygons](#) converts a spatial object from class SpatialGridDataFrame to SpatialPolygonsDataFrame.

An alternative approach to some of these issues is implemented in the [PBSmapping](#) package; [PBSmodelling](#) provides modelling support. In addition, [GEOmap](#) provides mapping facilities directed to meet the needs of geologists, and uses the [geomapdata](#) package.

Cookbook for R

Welcome to the Cookbook for R. The goal of the cookbook is to provide solutions to common tasks and problems in analyzing data.

Most of the code in these pages can be copied and pasted into the R command window if you want to see them in action.

1. [Basics](#)
2. [Numbers](#)
3. [Strings](#)
4. [Formulas](#)
5. [Data input and output](#)
6. [Manipulating data](#)
7. [Statistical analysis](#)
8. [Graphs](#)
9. [Scripts and functions](#)
10. [Tools for experiments](#)

My book about data visualization in R is available! The book covers many of the same topics as the Graphs and Data Manipulation sections of this website, but it goes into more depth and covers a broader range of techniques. You can preview it at [Google Books](#).

Purchase it from [Amazon](#), or direct from [O'Reilly](#).

This site is created by Winston Chang. It is not related to Paul Teetor's excellent [R Cookbook](#) ([Amazonlink](#)).
