What is Spatial Statistics?

Spatial(-temporal) Statistics

Experts' Thoughts

- Spatial statistics offers a way of describing the spatial continuity that is an essential feature of many natural phenomena and provides adaptations of classical regression techniques to take the advantage of this continuity

Isaaks and Srivastava, 1989. *An Introduction to Applied Geostatistics*

- Spatial statistics provides a set of statistical tools for incorporating the spatial coordinates of observations in data processing

Goovaerts, 2007. *Geostatistics for Natural Resources Evaluation*

Spatial(-temporal) Interpolation

Spatial(-temporal) Interpolation

Z

z is a random process with unique mean and variance
 $z(\text{sampled locations}) \approx z(\text{unsampled location})$

Spatial(-temporal) Interpolation

Input

- Set of Points sampled, sparsely distributed in space and time
- Each point represents a measurement of a variable (spatiotemporal attribute) that occurs in that space and time location

Spatial(-temporal) Interpolation

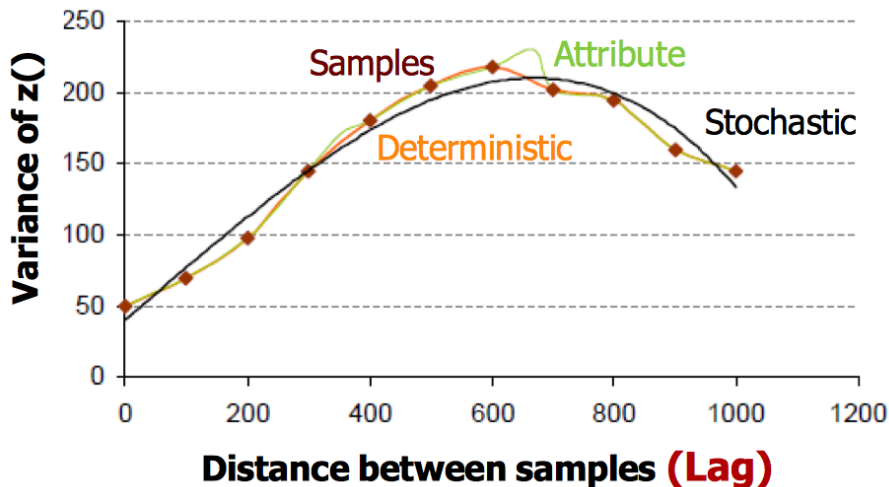

Input

- Set of Points sampled, sparsely distributed in space and time
- Each point represents a measurement of a variable (spatiotemporal attribute) that occurs in that space and time location

Output

- **Spatial Data Model**
- Computer/mathematical representation that allows one to perform estimations and/or simulations for attribute values at spatial/temporal locations not sampled

Spatial(-temporal) Variability

Spatial(-temporal) Variability

Spatial(-temporal) Variogram

Stochastic or Geostatistical Interpolation

- A probability distribution function is associated to its probable values
- Uncertainties can be associated to its estimation
- e.g. Kriging
- Minimization of estimation variance (error)

Deterministic Interpolation

- An unique value is associated to its spatial location
- No uncertainty is associated to its estimation
- e.g. Inverse Distance Weighting (IDW)

$$Z^*(x_0) = \frac{\sum_{i=1}^n \frac{1}{d_i^2} z(x_i)}{\sum_{i=1}^n \frac{1}{d_i^2}}$$

Spatio-temporal geostatistics using **gstat**

Edzer Pebesma

February 15, 2013

1 Introduction

Since **gstat** package version 1.0-0, a dependency of **gstat** on the R package **spacetime** was introduced, allowing the code in **gstat** to exploit spatio-temporal data structures from that package. This vignette describes the possibilities and limitations of the package for spatio-temporal geostatistics.

To understand some of the possibilities and limitations, some knowledge of the history of the software is needed. The original **gstat** software (Pebesma and Wesseling, 1998) was a standalone computer *program* written in around 25,000 lines of C code, and would do geostatistical modelling, prediction and simulation. The **gstat** R package (Pebesma, 2004) consisted mostly of an R interface to this C code, together with convenience functions to use R's modelling interface (formula's, see `?lm`) and graphic capabilities (trellis graphics in package **lattice** to show cross variogram as matrix plots; interaction with variogram clouds using base plots).

Starting 2003, a group of programmers developed a set of classes and methods for dealing with spatial data in R (points, lines, polygons, grids), which was supported by the publications of the well-known ASDAR book (Bivand et al.

Editorial Board

Established in 1996, the Journal of Statistical Software publishes articles, book reviews, code snippets, and software reviews on the subject of statistical software and algorithms. The contents are freely available online. For both articles and code snippets the source code is published along with the paper. Statistical software is the key link between statistical methods and their application in practice. Software that makes this link is the province of the journal, and may be realized as, for instance, tools for large scale computing, database technology, desktop computing, distributed systems, the World Wide Web, reproducible research, archiving and documentation, and embedded systems.

We attempt to present research that demonstrates the joint evolution of computational and statistical methods and techniques. Implementations can use languages such as C++, C, Fortran, Java, PHP, Python and Ruby or environments such as Mathematica, MATLAB, R, S-PLUS, SAS, Stata, and XLISP-STAT.
